Demo Script & Pitch Outline

A tight 3-minute spoken pitch with live demo, plus judge Q&A preparation

Segment	Time	Duration	Speaker	Goal
1. Hook / Problem	0:00 - 0:25	25 s	Pitch Lead	Make judges feel the gap between block and village
2. Solution & Why Unique	0:25 - 0:55	30 s	Pitch Lead	Explain the hybrid engine and 3 differentiators
3. Live Demo (6 steps)	0:55 - 2:20	85 s	Pitch Lead + FE driver	Show every Must feature working
4. Impact / Next / Close	2:20 - 3:00	40 s	ML Lead	Scale, integration with IMD, memorable closing line

Setup before you speak: app open on S1 in Demo Mode with Siddipet > Gajwel pre-selected in the dropdowns (not yet loaded); second screen or phone showing the farmer view; backup screen recording ready. One person talks, one person drives.

1. Hook / Problem [0:00 - 0:25]

Spoken script	On screen / action
"Imagine a cotton farmer in Siddipet. The forecast for his block says light rain, 8 millimetres, so he sprays pesticide in the morning. By afternoon, 40 millimetres fall on his village and wash it all away. Two villages away, not a drop."	Title slide, then a photo of a cotton field
"IMD's forecast was right - for the block. But a block covers dozens of panchayats. Farmers don't farm blocks. They farm villages."	Slide: one block outline filled with many panchayat outlines

2. Solution & Why Unique [0:25 - 0:55]

Spoken script	On screen / action
"We built PanchayatCast. It takes IMD's official block forecast and downscales it to every gram panchayat."	Slide: Block forecast -> PanchayatCast -> Panchayat map + advisory
"Our hybrid engine combines physics - temperature falls with elevation - with machine learning trained on twenty years of terrain, land-use and rainfall data. It runs in minutes on a single server."	Architecture strip (Doc 04, simplified)
"Three things make it different. It stays consistent with IMD's official forecast. It tells you how confident it is. And it ends not in a number, but in an action - in the farmer's own language."	Three icons: IMD-consistent | Confidence | Local-language action

3. Live Demo Walkthrough [0:55 - 2:20]

Spoken script	On screen / action
"I'm Lakshmi, an agriculture extension officer. I open PanchayatCast and choose Siddipet, Gajwel block."	**Step 1 (S1):** click Open Block Dashboard [~10 s]
"On the left is what we have today: one block, one value, 8 millimetres. On the right, the same forecast downscaled - rain ranging from zero to 38 millimetres across the panchayats. Same for temperature."	**Step 2 (S2):** split map; switch Rain -> Tmax -> back; move day slider [~15 s]
"I tap Ahmadipur. Tuesday: 38 millimetres, 72 percent probability, high confidence - thirty millimetres more than the block value."	**Step 3 (S3):** 5-day cards, confidence pill, alert banner [~15 s]
"Cotton, square formation stage. PanchayatCast says: postpone spraying, clear drains before Tuesday, and top-dress urea today while it's dry - and it shows why."	**Step 4 (S4):** pick crop + stage; expand one "Why?" [~15 s]
"One tap to Telugu, and I send it to Ahmadipur's farmers. Here it is on Ramesh's phone."	**Step 5 (S5):** Telugu tab, Send; phone mockup animates [~15 s]
"But is it accurate? On stations we never trained on, our temperature error is lower than the block baseline, and on this event day the block said 6 millimetres, the station recorded 41, and we predicted 35."	**Step 6 (S6):** KPI cards + backtest event card [~15 s]

Replace all numbers with your real validated results before the final. Never quote a metric you cannot show on screen.

4. Impact / What's Next / Closing [2:20 - 3:00]

Spoken script	On screen / action
"India has about two and a half lakh gram panchayats. PanchayatCast needs no new weather model - it post-processes IMD's existing forecast, so it can plug into GKMS bulletins and IMD's farmer apps and scale zone by zone."	Slide: India map with scale-up path
"Next, we're adding village-level monsoon onset and false-onset warnings, so farmers know not just what to do this week, but when to sow. Then voice advisories for farmers who can't read, and a pilot with a District Agromet Unit."	Slide: Roadmap - Onset alerts | Voice/IVR | DAMU pilot
"IMD tells India what the weather will be. PanchayatCast tells every village what to do about it. Thank you."	Final slide: logo + tagline + team

Expected Judge Questions & Answers

Q1. How do you know the panchayat forecast is more accurate when there are so few ground stations?

> We train on satellite and reanalysis data (ERA5-Land, CHIRPS) and keep AWS stations completely out of training. Accuracy is measured only on those held-out stations, against the simple baseline of copying the block value to every panchayat. For rainfall we use IMD's own categorical scores - POD, FAR and CSI.

Q2. Why a statistical + ML hybrid instead of deep learning or a WRF model?

> WRF at 1 km needs supercomputer time for every run; our engine runs in minutes on one server. Pure deep learning needs far more paired data and is hard to explain to officers. Physics handles what is well understood (lapse rate), ML learns the rest, and every advisory can be traced back to a rule and a value. A U-Net benchmark is on our roadmap.

Q3. Rainfall at village scale is chaotic. Aren't you creating false precision?

> That is exactly why we publish probabilities and a High / Medium / Low confidence badge instead of a single number. Advisories trigger on probability thresholds, for example 'over 60% chance of more than 10 mm'. Where confidence is low, the advice falls back to cautious, block-level guidance.

Q4. How does this fit with IMD's existing GKMS and panchayat-level services?

> We don't replace them - we sit on top. Our input is IMD's official block forecast and our output is rescaled so the panchayat values average back to that forecast, so there is never a contradiction. The output is a REST API and bulletin format that existing apps and DAMU workflows can consume directly.

Q5. How will this scale nationally, and what does it cost to run?

> Only three things change per region: static terrain and land-use layers (free, national coverage), panchayat boundaries, and a model retrained per agro-climatic zone. One district runs in under five minutes on a single cloud VM, so a state can run on a few servers at very low cost, fully on open-source software.

Demo-Day Checklist

- Rehearse the full 3 minutes at least 3 times with a stopwatch; cut words, never cut demo steps.
- Run in Demo Mode with a cached forecast date so Wi-Fi failures cannot break the flow.
- Keep a 90-second screen recording of the demo as a backup.
- Pre-load every map layer once so tiles are cached before judges arrive.
- Every team member should be able to answer Q1 and Q3 - these are the most likely questions.
- Bring one printed page: the validation metrics table with method notes.
